

# Clinical Analytics Scorecards

## Frequently Asked Questions

### What is a scorecard?

Scorecards are interactive and drillable dashboards that can be designed and customized to meet the needs of the patient population being analyzed.

### What is the difference between scorecard templates and custom scorecards?

Scorecard templates are scorecards that can be shared across users (but still retain a single owner who can make changes). Custom scorecards are unique to an individual user, where that user is the only person who can see and make changes to the scorecard. Custom scorecards can be converted to scorecard templates and shared with other users at any time.

### Do I have to create scorecards from scratch?

No, Clinical Analytics provides a library of scorecards to use as “starting points.” Users also have the ability to “copy” existing scorecards, as well as customize existing scorecards.

### Can I customize a scorecard?

Yes, as a user, you can customize any of your custom scorecards or make a copy of a template scorecard to further customize without making changes to a scorecard template that is owned by another user.

### Can I give other users access to my custom scorecards?

Yes, custom scorecards can easily be converted to scorecard templates and then shared across selected users in the system.

### How can I export the data on a scorecard?

Scorecard data can be exported in a few different ways: pdf, Excel, and csv. Scorecards visuals and graphics can be exported to PDF for further distribution/analysis. Data tables can be exported to Excel or csv for further distribution/analysis.

### How do I create different patient populations on a scorecard?

Profiles! Users can define patient populations for analysis using the profiles icon of any scorecard. Profiles define a patient population, are unique to individual scorecards, and can be customized using any combination of around 40+ filters. For more information on profiles, see the FAQ or documentation on Profiles.
